

## Mathematic Curriculum Map Overview

Topic	Skills	Approximate Days of Study
Module 1	<ul style="list-style-type: none"> <li>• Draw triangles based on given measurements</li> <li>• Know precise definition of angle, circle, perpendicular and parallel lines, and line segments</li> <li>• Identify translations, reflections and rotations as rigid motion</li> <li>• Describe the rotations and reflections that carry it on to itself given a rectangle, parallelogram, trapezoid, or regular polygon,</li> <li>• Apply a rigid motion to informally show that two triangles are congruent</li> <li>• Explain how the criteria for triangle congruence (ASA, SAS, SSS) follow the definition of congruence in terms of rigid motion</li> <li>• Build upon a foundation of congruent triangles to develop formal proof techniques</li> <li>• Make conjectures and construct viable arguments to prove theorems using a variety of formats</li> <li>• Solve problems about triangles, quadrilaterals and other polygons</li> <li>• Perform basic constructions such as copying a segment, bisect an angle, perpendicular bisector and parallel lines</li> <li>• Construct figures (equilateral triangle, square, and a regular hexagon inscribed in a circle) by manipulating appropriate geometric tools (protractor, compass, etc.)</li> <li>• Justify why written instructions produce a desired figure</li> <li>• Compare transformations that preserve distance and angle to those that do not</li> <li>• Draw the transformed figure using graph paper, tracing paper, or geometric software given a geometric figure and a rotation, reflection or translation</li> <li>• Prove theorems about parallel lines and angles</li> <li>• Prove theorems about triangles</li> <li>• Prove theorems about parallelograms</li> </ul>	45 days
Module 2	<ul style="list-style-type: none"> <li>• Use prior knowledge of dilations and proportional reasoning to build a formal understanding of similarity</li> <li>• Identify criteria for similarity of triangles</li> <li>• Make sense of and persevere in solving similarity problems</li> <li>• Apply similarity to right triangles to prove the Pythagorean Theorem</li> <li>• Apply the trigonometric ratios to find missing measurements of general (not necessarily right) triangles</li> <li>• Model and make sense of indirect measurement problems</li> <li>• Model and make sense of geometric problems that involve ratios or rates</li> <li>• Verify properties of dilations given by a center and a scale factor</li> <li>• Use the properties of similarity transformations to establish the AA criterion for two triangles to be similar</li> <li>• Prove that a line parallel to one side of a triangle divides the other two sides proportionally (and conversely)</li> <li>• Explain and use the relationship between sine and cosine of complementary angles</li> </ul>	45 days
Module 3	<ul style="list-style-type: none"> <li>• Extend previous knowledge of the use of the circumference formula</li> <li>• Extend previous knowledge of the use of the area formulas</li> <li>• Extend previous knowledge of the use of the volume formulas</li> <li>• Apply knowledge of two dimensional shapes to be able to identify a cross section of a 3D object</li> <li>• Apply knowledge of two dimensional shapes to be able to identify what 3D object will be formed when rotated about a line</li> <li>• Reason abstractly and quantitatively to model problems using volume formulas</li> <li>• Use the volume formula for cylinders, pyramids, cones and spheres to solve problems</li> </ul>	16 days
Module 4	<ul style="list-style-type: none"> <li>• Use the Pythagorean Theorem to derive the distance formula</li> <li>• Use of distance, midpoint and slope formula to prove properties of special triangles and quadrilaterals</li> <li>• Prove the slope criteria for parallel and perpendicular lines and use them to solve geometric problems</li> <li>• Connect the geometric and algebraic definitions of parabolas</li> <li>• Find the point on a directed line segment between two points that partitions the segment into a given ratio</li> <li>• Use coordinates to compute perimeters of polygons and area of triangles and rectangles</li> <li>• Use coordinates to prove simple geometric theorems algebraically</li> </ul>	25 days
Module 5	<ul style="list-style-type: none"> <li>• Prove all circles are similar</li> <li>• Identify and describe relationships among inscribed angles, central angles, radii and chords</li> <li>• Prove that an inscribed angle on a diameter is a right angle</li> <li>• Prove that the radius of a circle is perpendicular to the tangent where the radius intersects the circle</li> <li>• Construct an inscribed circle of a triangle</li> <li>• Construct a circumscribed circle of a triangle</li> <li>• Prove properties of angles for a quadrilateral inscribed in a circle</li> <li>• Derive, using similarity, that the length of the arc intercepted by an angle is proportional to the radius</li> <li>• Define measure of an angle as the constant of proportionality</li> <li>• Derive the formula for the area of a sector</li> <li>• Derive the equation of a circle given the center and the radius using the Pythagorean Theorem</li> <li>• Complete the square to find the center and radius of a circle given by an equation</li> <li>• Use coordinates to prove simple geometric theorems algebraically</li> <li>• Use geometric shapes, their measures and their properties to describe objects (example: modeling a tree trunk or a human torso as a cylinder)</li> </ul>	25 days
EOY Review	<ul style="list-style-type: none"> <li>• Review of essential content and skills from the year.</li> </ul>	20 days
